

## Brainstorming & Idea Prioritization Template

|                      |                           |
|----------------------|---------------------------|
| <b>Date</b>          | 01 October 2026           |
| <b>Team ID</b>       | SWTID-2026-1564           |
| <b>Project Name</b>  | Courier Management System |
| <b>Maximum Marks</b> | 3 Marks                   |

### Step 1: Brainstorm and Idea Listing

Each team member lists out as many ideas as possible without judging them at this stage.

| S.No | Team Member      | Idea / Suggestion                                                                                  | Category        | Group No. |
|------|------------------|----------------------------------------------------------------------------------------------------|-----------------|-----------|
| 1    | Yusra Mehek N    | Manage courier records, shipments and delivery updates in a centralized Salesforce CRM application | Cloud CRM       | 3         |
| 2    | Shalini B        | Continue with a manual register to record parcels, customers and deliveries                        | Manual / Paper  | 1         |
| 3    | Nafia Tabassum R | Store courier details in spreadsheets with simple filters                                          | Digital Storage | 1         |
| 4    | Zainul Arab L    | Build a separate custom web portal for parcel booking and tracking                                 | Custom Web      | 2         |
| 5    | Saima Suman P    | Use Salesforce Flow to automatically update shipment status from delivery updates                  | Automation      | 3         |
| 6    | Yusra Mehek N    | Create reports and a dashboard for shipment status, agent performance and branch revenue           | Analytics       | 3         |

### Step 2: Idea Prioritization

Rate each grouped idea on feasibility and importance, then select the final idea(s) to move forward with.

| Group No. | Final Idea                                                                                     | Feasibility (High/Medium/Low) | Importance (High/Medium/Low) | Priority | Selected (Yes/No) |
|-----------|------------------------------------------------------------------------------------------------|-------------------------------|------------------------------|----------|-------------------|
| 1         | Manual register / spreadsheet storage (easy to start, but hard to search, update and automate) | High                          | Low                          | Low      | No                |
| 2         | Separate custom web portal (customizable, but needs additional infrastructure)                 | Medium                        | Medium                       | Medium   | No                |

| Group No. | Final Idea                                                                                                         | Feasibility (High/Medium/Low) | Importance (High/Medium/Low) | Priority | Selected (Yes/No) |
|-----------|--------------------------------------------------------------------------------------------------------------------|-------------------------------|------------------------------|----------|-------------------|
| 3         | Salesforce CRM with custom objects, validation rules, Flow automation, role-based security, reports and dashboards | High                          | High                         | High     | Yes               |

**Outcome:** Group 3 was selected because Salesforce provides a cloud-based platform with built-in automation, security and analytics, so the team can demonstrate an end-to-end business application without building infrastructure from scratch.
